Requirement Gathering Report

Web-Based Event Planning System

Module Code: SE2030

Module Name: Software Engineering

Calendar Year: 2026

Semester: Year 2, Semester 1

Group ID: 2026-Y2-S1-MLB-B10G1-02

Project Topic: Web-Based Event Planning System

Group Members

	Full Name	Student ID
1	Chathuranga B.G.	IT25101514
2	Wickramarathna W. L. S.	IT25102322
3	Keshavan M.	IT25103301
4	Suriyage O.W	IT25100916
5	Gunasekara N.B.	IT25102923
6	Wickramasinghage C.P.W	IT25100220

Introduction

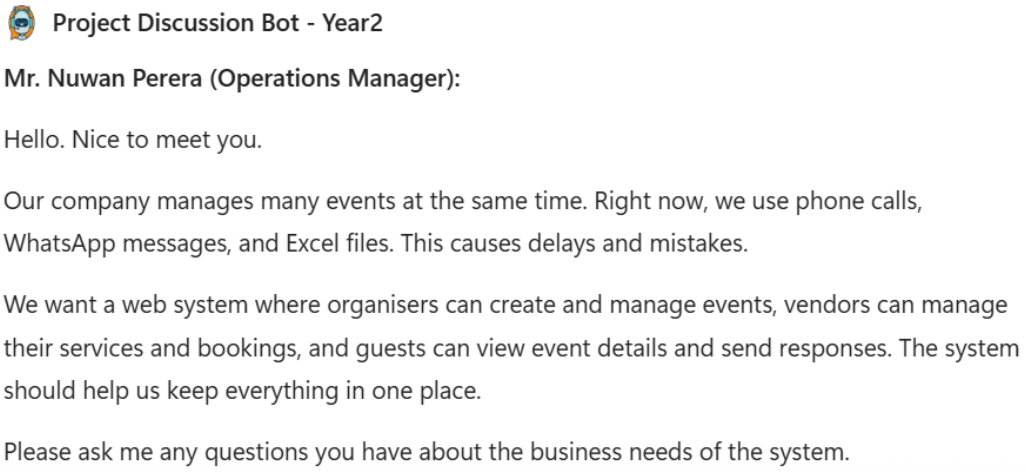

This report documents the requirement gathering process carried out by our group for the SE2030 Software Engineering group project. Our assigned topic is a web-based event planning system. The system is intended to help event coordinators, vendors, finance staff, and guests manage the full lifecycle of an event from planning and scheduling, to vendor and payment coordination, to guest communication on a single platform.

Requirement Gathering Process Summary

We used the Project Discussion Bot to simulate conversations with stakeholders of a fictional organisation running events. We introduced our project topic, and the bot generated relevant personas for us to interview. Below is a summary of each conversation, along with the corresponding screenshot evidence.

stakeholders

Mr. Nuwan Perera – Operations Manager
Ms. Dilani Fernando – Senior Event Coordinator
Mr. Sahan Jayasinghe – Vendor Relations Officer
Ms. Tharushi Ekanayake – Customer Experience Executive
Mr. Chamath Wijesuriya – Finance and Administration Officer

Project Discussion Bot - Year2

Mr. Nuwan Perera (Operations Manager):

When an organiser creates an event, we first check the event details. We look at the date, venue, expected number of guests, and any special requirements.

If all information is correct and the resources are available, we approve the event. If something is missing or there is a conflict, we send it back to the organiser for changes before approval.

This approval process is something we would like the new system to support.

How do you receive booking requests?

Project Discussion Bot - Year2

Mr. Sahan Jayasinghe (Vendor Relations Officer):

At the moment, booking requests usually come from event organisers. They contact us through phone calls, email, or messages and ask about vendor availability.

In the new system, we want organisers to send booking requests directly through the website. The vendor should receive the request, check availability, and then accept or reject it through the system.

This will help us keep all booking records in one place and reduce mistakes.

How do you planning and schedule

Project Discussion Bot - Year2

Ms. Dilani Fernando (Senior Event Coordinator):

We start by creating an event plan after the event is approved. We add important details such as the date, venue, activities, vendors, and staff members.

Then we create a schedule with all tasks and timelines. We monitor the schedule regularly and update it if there are any changes.

In the new system, we would like a calendar view and task tracking so everyone can see their responsibilities and deadlines easily.

What business problems do you expect this system to solve?

Project Discussion Bot - Year2

Mr. Chamath Wijesuriya (Finance and Administration Officer):

The biggest problem is that our information is scattered across phone calls, emails, paper documents, and spreadsheets. This makes it hard to track events, bookings, payments, and vendor details.

We expect the new system to reduce booking mistakes, avoid double bookings, improve payment tracking, and give us accurate records in one place. We also want faster reporting so management can see the status of events and finances easily.

Overall, the system should save time, improve coordination between organisers and vendors, and reduce manual work.

What features do you consider most important for customers?

Project Discussion Bot - Year2

Ms. Tharushi Ekanayake (Customer Experience Executive):

For our customers, the most important features are ease of use and convenience.

They should be able to create events, view event details, manage guest lists, send invitations, and track bookings without difficulty. Customers also want to see vendor information, booking status, schedules, and payment details in one place.

It would be very helpful if the system could send notifications or reminders about important event updates and upcoming deadlines.

Identified Users and Roles

User	Role in the System
Administrator	Manages the entire system, including user accounts, event records, venues, vendors, inventory, and system reports.
Customer	Registers an account, creates and manages events, books venues and vendors, views schedules, and manages their profile.
Event Manager	Oversees event planning, approves bookings, coordinates schedules, manages inventory, and ensures events run successfully.
Vendor / Service Provider	Offers services (catering, decoration, photography, etc.), receives and responds to booking requests.
Inventory Staff	Maintains event inventory, updates stock levels, records equipment usage, and ensures required resources are available for events.
Guest / Attendee	Views event details, registers, and pays for tickets.

Final List of Core Functions

Based on the requirement gathering process above, our group has identified the following six core functions for The System.

1. User Registration & Login

Description

The User Registration & Login function allows users to securely create an account and access the system based on their assigned role, such as Customer, Event Manager, Vendor, or Administrator. It ensures that only authorized users can use the system while protecting personal information through secure authentication. This function serves as the entry point to the system and provides different levels of access according to user responsibilities.

Sub-functions

- Register a new account
- User login
- Password reset
- User authentication
- Logout

2. Event Creation & Management

Description

This function enables customers and event managers to create, organize, and manage events efficiently. Users can enter important event details such as the event type, date, time, venue, expected number of guests, and special requirements. The system also allows users to modify event information, monitor event progress, and cancel events when necessary.

Sub-functions

- Create a new event
- View event details
- Update event information
- Cancel/Delete an event
- Track event status

3. Venue & Vendor Booking

Description

The Venue & Vendor Booking function allows customers to browse available venues and service providers such as caterers, decorators, photographers, entertainers, and sound system providers. Users can compare available options, check availability, and make bookings based on their event requirements. The system helps avoid double bookings by updating availability in real time.

Sub-functions

- Search venues
- Search vendors
- Check availability
- Book venue/vendor
- payment processing

4. Schedule Management

Description

The Schedule Management function helps organize all activities related to an event. It allows event managers to create detailed schedules, assign responsibilities to staff, and monitor task completion before and during the event. The system also helps prevent scheduling conflicts by maintaining a centralized event calendar and sending reminders for important activities.

Sub-functions

- Create event schedules
- Assign tasks to staff
- Update schedules
- View event calendar
- Send reminders

5. Inventory Management

Description

The Inventory Management function is responsible for managing all equipment and materials required for events, such as tables, chairs, decorations, lighting equipment, audio systems, and other resources. It helps staff keep track of stock availability, update inventory records, and ensure that sufficient resources are available before each event to avoid shortages.

Sub-functions

- Add inventory items
- View inventory records
- Update stock quantity
- Remove inventory items
- Track equipment usage

6. Customer Management

Description:

The Customer Management function enables administrators and event managers to maintain customer information throughout the event planning process. It stores customer profiles, contact details, booking history, and communication records. This function helps improve customer service by providing easy access to customer information and allowing staff to manage customer requests efficiently.

Sub-functions

- Add customer records
- View customer profiles
- Update customer information
- Delete customer records
- View booking history
